

Due to certain contractual and non-disclosure agreements with clients, many of my freelance projects cannot be made publicly-accessible via my website, nor can I post the source code to a public GitHub repo. Please see below for a sampling of my recent professional work, as well as direct links to private GitHub repos provided via Gitfront.io.

PROFESSIONAL PORTFOLIO

WordPress Dynamic Post Filter & Search via Custom REST API

For multiple existing WordPress sites with hundreds of pre-existing posts stored across numerous custom post types and with numerous custom meta fields & taxonomies, I built out functionality to allow site visitors to dynamically search & filter results across multiple parameters. I accomplished this by building out a series of custom REST API endpoints on the WordPress backend, and then implementing an AJAX-based filter on the front-end. Solution was built to scale, with the ability to handle multiple different post types, meta fields, as well as account for future client additions. I am currently in the process of converting this solution into a standalone WordPress plugin for one of my agency clients.

Toyota Career Expo – Applicant Progress Tracker

For Toyota's new 2021 "Drive to Employment" website, I built out a basic progress-tracking system for registered users. The broader site was pre-existing and built in WordPress, and utilizing a third-party "user-registration/membership" plugin. I built in extra functionality on top of this, that tracks and saves user progress as they advance through various sections of the site. Additionally I also added functionality to allow registered visitors to 'bookmark' pages, posts, and videos to their profile page for later viewing.

Digital Advertisement Scraper App

Assisted in building a full-stack JavaScript app that takes a user-entered URL and scrapes that site for certain advertising-related content. For each result found within the scraped site, various metadata is saved along with a screenshot and a timestamp. Results are saved to a database which can then be viewed, edited, or deleted by the admin user. Uses Strapi.io and Node.js on the back-end, SQLite as the database, and React.js on the front-end.

PROFESSIONAL PORTFOLIO (cont)

ErosSTX

Took an existing WordPress site which had been previously built with the Divi page builder and converted it to a custom-built solution, while still maintaining the exact same look-and-feel of the site. Due to the media-heavy nature of the site, this conversion significantly improved overall page speed and performance of the site.

 <https://erosstx.com>

Sultre

Built out a brand-new e-commerce site for a high-end boutique brick-and-mortar retailer. Site was built upon the BigCommerce back-end platform and included numerous integrations with various third-party services.

Various Custom WordPress Builds

Have completed numerous custom WordPress builds for various agency clients. All sites feature custom-built themes (usually based on either underscores + bootstrap, or an internal agency boilerplate theme) based on high-fidelity mockup designs, with a general goal of avoiding third-party plugin bloat. Most sites make heavy use of ACF and Custom Post Types, and are designed to allow a non-technical end-client to manage the site.
